

## ***My favorite amphibian* BY TAELEER LIEBENTRITT**

My amphibian is called the tailed frog!!!!

I chose this amphibian because it looks interesting, it is native to the North West, and because

It is NOT poisonous! I hope to get this animal some day soon!

### **ALL ABOUT THE TAILED FROG**

The tailed frog is an amphibian that lives half its life in the cold fast streams in the forest. As a tad pole this frog is born in the fast cool streams and attached to a rock to keep from flowing down stream. After hatched it flows threw the water for about a month,

When ready it uses its extremely strong jaws to help pull itself out of the water! It takes about a year until this frog is ready to mate.

### **FOOD AND LENGHTH**

This frog has a strict diat nsects and spiders. If it eats any thing elss for example crackers, bread, even other animal food like fish flakes “ not like it would eat it any way”

It could get sick and may die!!

This frog can get up to tow inches long and with its scientific name “Ascaphus trule” Witch is really hard to pronounce! This frog could be the perfect pet for a home willing to give the time and money for it.
